#### **Operational Semantics**

#### KC Sivaramakrishnan Spring 2020

## Language

Numbers $n \in \mathbb{N}$ Variables $x \in Strings$ Expressions $e ::= n | x | e + e | e - e | e \times e$ Commands $c ::= skip | x \leftarrow e | c; c | if e then c else c | while e do c$ 

## **Big Step Semantics**

• Says what the result is when the program terminates

$$\begin{array}{c} \hline (v,\mathsf{skip}) \Downarrow v & \hline (v,x \leftarrow e) \Downarrow v[x \mapsto \llbracket e \rrbracket v] & \hline (v,c_1) \Downarrow v_1 & (v_1,c_2) \Downarrow v_2 \\ \hline (v,\mathsf{skip}) \Downarrow v & \hline (v,x_1) \Downarrow v' & \llbracket e \rrbracket v = 0 & (v,c_1) \Downarrow v' \\ \hline (v,\mathsf{if}\ e\ \mathsf{then}\ c_1\ \mathsf{else}\ c_2) \Downarrow v' & \hline (v,\mathsf{if}\ e\ \mathsf{then}\ c_1\ \mathsf{else}\ c_2) \Downarrow v' \\ \hline [e \rrbracket v \neq 0 & (v,c_1) \Downarrow v_1 & (v_1,\mathsf{while}\ e\ \mathsf{do}\ c_1) \Downarrow v_2 & \hline [e \rrbracket v = 0 \\ \hline (v,\mathsf{while}\ e\ \mathsf{do}\ c_1) \Downarrow v_2 & \hline [e \rrbracket v = 0 \\ \hline (v,\mathsf{while}\ e\ \mathsf{do}\ c_1) \Downarrow v_2 \end{array}$$

## Small Step Semantics

• Big step semantics only says something about *terminating* programs

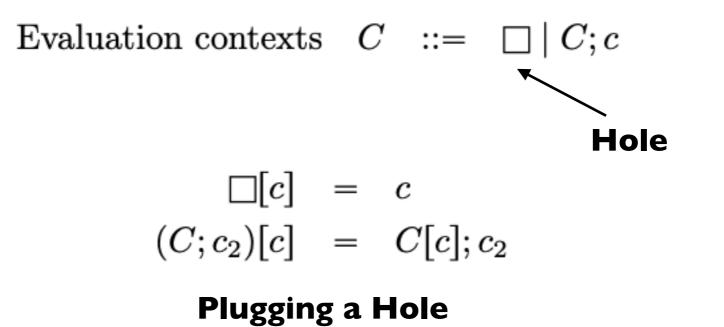

- Program may not terminate (web server)
- Unclear how to model concurrent interleaving of threads
- Says what the result is when the program takes a single step
  - Can model non-termination, concurrency

$$\begin{array}{l} \hline (v,x\leftarrow e)\rightarrow (v[x\mapsto \llbracket e\rrbracket v],\mathsf{skip}) & \hline (v,c_1)\rightarrow (v',c_1') \\ \hline (v,x\leftarrow e)\rightarrow (v[x\mapsto \llbracket e\rrbracket v],\mathsf{skip}) & \hline (v,c_1;c_2)\rightarrow (v',c_1';c_2) & \hline (v,\mathsf{skip};c_2)\rightarrow (v,c_2) \\ \\ & \hline \llbracket e\rrbracket v\neq 0 & \hline (v,\mathsf{if}\ e\ \mathsf{then}\ c_1\ \mathsf{else}\ c_2)\rightarrow (v,c_1) & \hline (v,\mathsf{if}\ e\ \mathsf{then}\ c_1\ \mathsf{else}\ c_2)\rightarrow (v,c_2) \\ \\ & \hline \llbracket e\rrbracket v\neq 0 & \hline [e\rrbracket v=0 \\ \hline (v,\mathsf{while}\ e\ \mathsf{do}\ c_1)\rightarrow (v,c_1;\mathsf{while}\ e\ \mathsf{do}\ c_1) & \hline (v,\mathsf{while}\ e\ \mathsf{do}\ c_1)\rightarrow (v,\mathsf{skip}) \end{array}$$

### Congruence rules are tedious

$$\frac{(v, c_1) \to (v', c_1')}{(v, c_1; c_2) \to (v', c_1'; c_2)}$$

#### **Contextual Small-step Semantics**

# Contextual Small-step Semantics for cmd

$$\begin{array}{c} \hline \hline (v,x\leftarrow e)\rightarrow_0(v[x\mapsto \llbracket e \rrbracket v],\mathsf{skip}) & \hline (v,\mathsf{skip};c_2)\rightarrow_0(v,c_2) \\ \\ \hline \llbracket e \rrbracket v \neq 0 & & \llbracket e \rrbracket v = 0 \\ \hline (v,\mathsf{if}\ e\ \mathsf{then}\ c_1\ \mathsf{else}\ c_2)\rightarrow_0(v,c_1) & \hline (v,\mathsf{if}\ e\ \mathsf{then}\ c_1\ \mathsf{else}\ c_2)\rightarrow_0(v,c_2) \\ \\ \hline \llbracket e \rrbracket v \neq 0 & & & \llbracket e \rrbracket v = 0 \\ \hline (v,\mathsf{while}\ e\ \mathsf{do}\ c_1)\rightarrow_0(v,c_1;\mathsf{while}\ e\ \mathsf{do}\ c_1) & & & & & \\ \hline (v,\mathsf{c}[c])\rightarrow_\mathsf{c}(v',c') \\ \hline (v,C[c])\rightarrow_\mathsf{c}(v',C[c']) \end{array}$$

#### **Contextual Small-step Semantics for** cmd

THEOREM 7.11. There exists valuation v such that ( $\bullet$ [input  $\mapsto 2$ ], factorial)  $\rightarrow_c^*$ (v, skip) and v(output) = 2.

PROOF.

```
(\bullet[\texttt{input} \mapsto 2], \texttt{output} \leftarrow 1; \texttt{factorial_loop})
         (\bullet[\texttt{input} \mapsto 2], (\Box; \texttt{factorial_loop})[\texttt{output} \leftarrow 1])
\rightarrow_{c} (•[input \mapsto 2][output \mapsto 1], skip; factorial_loop)
         (\bullet[\texttt{input} \mapsto 2][\texttt{output} \mapsto 1], \Box[\texttt{skip}; \texttt{factorial_loop}])
 =
        (\bullet[input \mapsto 2][output \mapsto 1], factorial_loop)
\rightarrow_{c}
         (\bullet[\texttt{input} \mapsto 2][\texttt{output} \mapsto 1], \Box[\texttt{factorial_loop}])
 =
\rightarrow_{c} (•[input \mapsto 2][output \mapsto 1], (output \leftarrow output \times input; input \leftarrow input -1); factorial_loop)
         (\bullet[\texttt{input} \mapsto 2][\texttt{output} \mapsto 1], ((\Box; \texttt{input} \leftarrow \texttt{input} - 1); \texttt{factorial_loop})[\texttt{output} \leftarrow \texttt{output} \times \texttt{input}])
 =
        (\bullet[\texttt{input} \mapsto 2][\texttt{output} \mapsto 2], (\texttt{skip}; \texttt{input} \leftarrow \texttt{input} - 1); \texttt{factorial_loop})
\rightarrow_{c}
         (\bullet[\texttt{input} \mapsto 2][\texttt{output} \mapsto 2], (\Box; \texttt{factorial_loop})[\texttt{skip}; \texttt{input} \leftarrow \texttt{input} - 1)]
 =
\rightarrow_{c} (•[input \mapsto 2][output \mapsto 2], input \leftarrow input -1; factorial_loop)
          (\bullet[\texttt{input} \mapsto 2][\texttt{output} \mapsto 2], (\Box; \texttt{factorial_loop})[\texttt{input} \leftarrow \texttt{input} - 1])
 =
         (\bullet[input \mapsto 1][output \mapsto 2], skip; factorial_loop)
\rightarrow_{c}
          (\bullet[\texttt{input} \mapsto 1][\texttt{output} \mapsto 2], \Box[\texttt{skip}; \texttt{factorial_loop}])
 =
→*
c
\rightarrow_{c} (•[input \mapsto 0][output \mapsto 2], skip)
     Clearly the final valuation assigns output to 2.
```

## Equivalence

**7.3.1. Equivalence of Small-Step, With and Without Evaluation Con-texts.** This new semantics formulation is equivalent to the other two, as we establish now.

THEOREM 7.12. If  $(v, c) \rightarrow (v', c')$ , then  $(v, c) \rightarrow_{c} (v', c')$ . PROOF. By induction on the derivation of  $(v, c) \rightarrow (v', c')$ . LEMMA 7.13. If  $(v, c) \rightarrow_{0} (v', c')$ , then  $(v, c) \rightarrow (v', c')$ . PROOF. By cases on the derivation of  $(v, c) \rightarrow_{0} (v', c')$ . LEMMA 7.14. If  $(v, c) \rightarrow_{0} (v', c')$ , then  $(v, C[c]) \rightarrow (v', C[c'])$ .

PROOF. By induction on the structure of evaluation context C, appealing to the last lemma.

THEOREM 7.15. If  $(v, c) \rightarrow_{\mathsf{c}} (v', c')$ , then  $(v, c) \rightarrow (v', c')$ .

PROOF. By inversion on the derivation of  $(v, c) \rightarrow_{c} (v', c')$ , followed by an appeal to the last lemma.

## Context Payoff: Concurrency

Commands  $c ::= \ldots |c||c$ 

Evaluation contexts  $C ::= \dots |C||c|c||C|$ 

 $\overline{(v,\mathsf{skip}||c) \to_0 (v,c)}$
